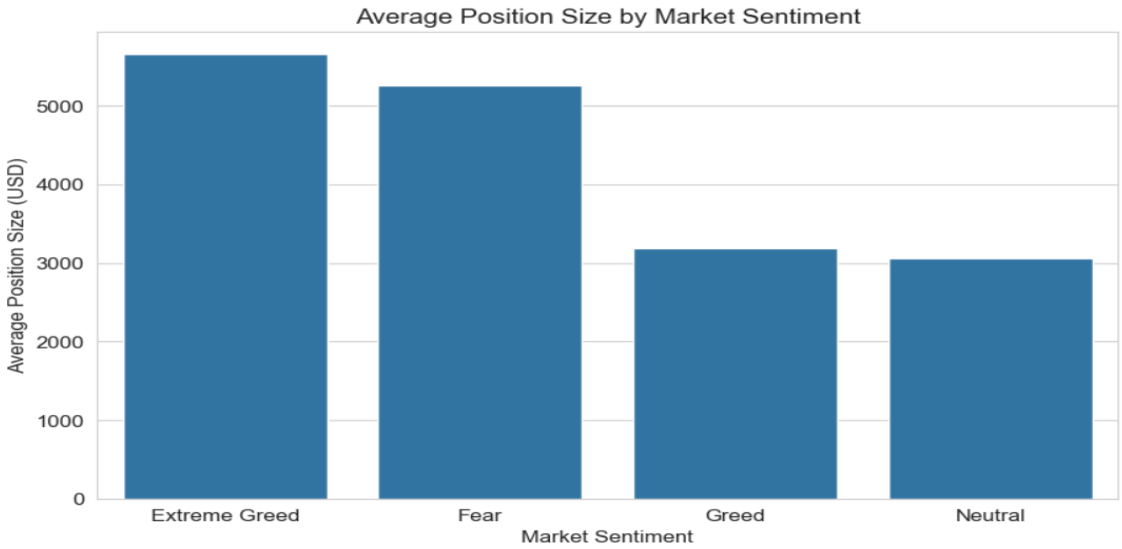
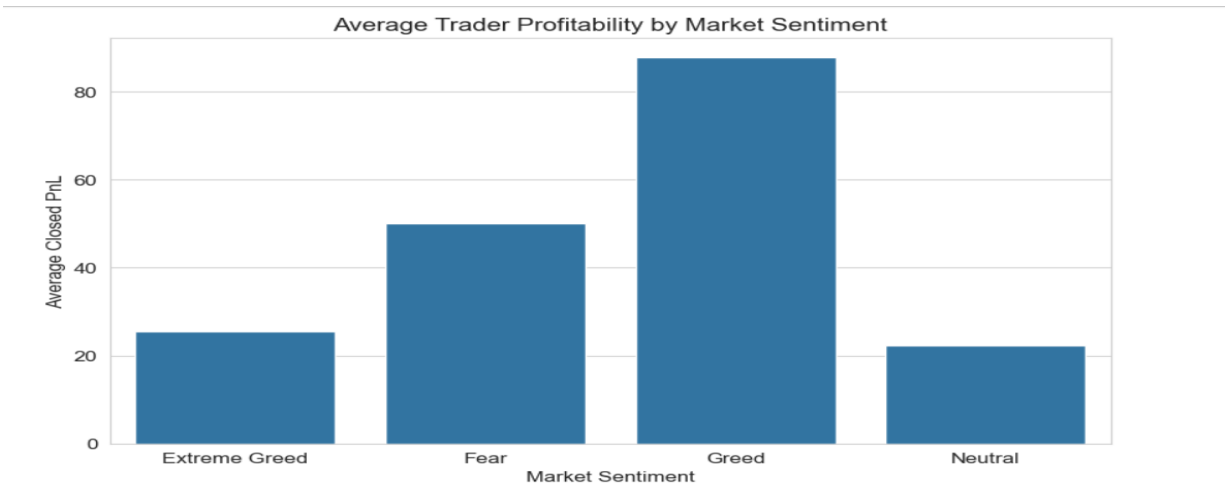
Charts From Trader_Sentiment_Analysis



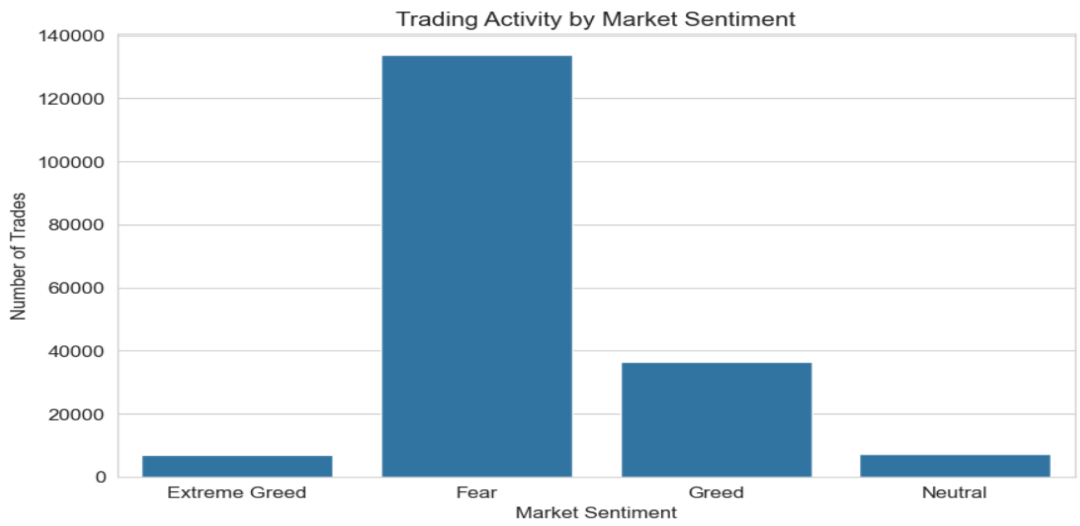
Average Position Size by Market Sentiment

Shows that traders tend to take **larger position sizes during Extreme Greed and Fear markets**, indicating higher risk appetite during emotionally charged market conditions.



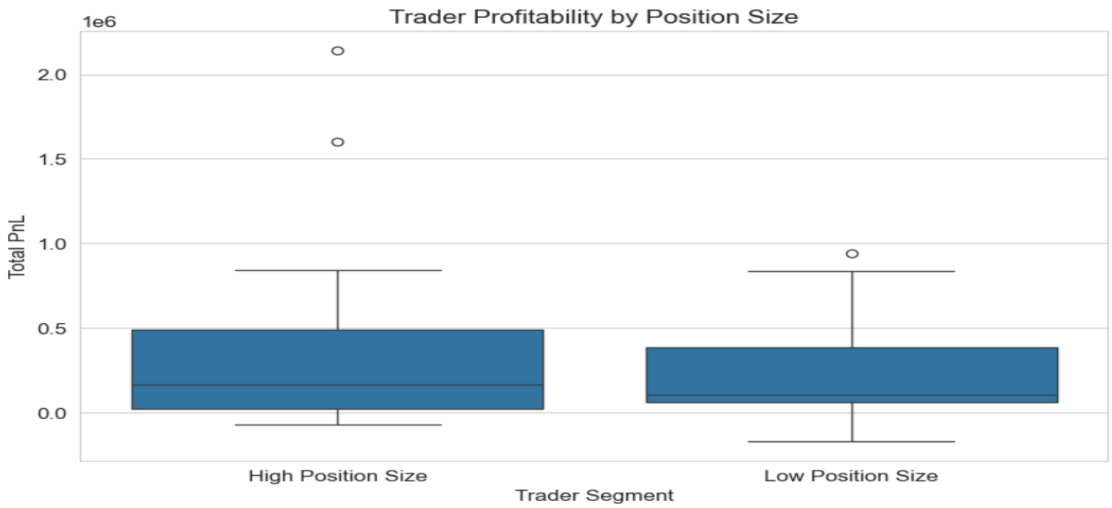
Average Trader Profitability by Market Sentiment

Illustrates that **average trader profitability varies across sentiment regimes**, with Greed markets showing the highest average profits in this dataset.



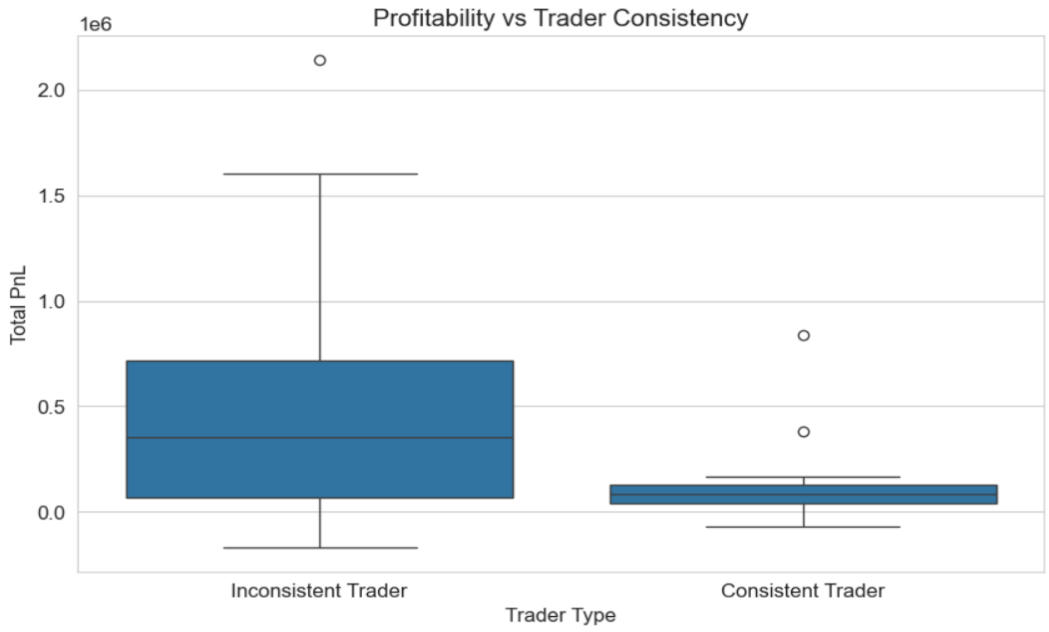
Trading Activity by Market Sentiment

Demonstrates that **Fear markets experience the highest trading activity**, suggesting traders become more active during volatile or uncertain conditions.



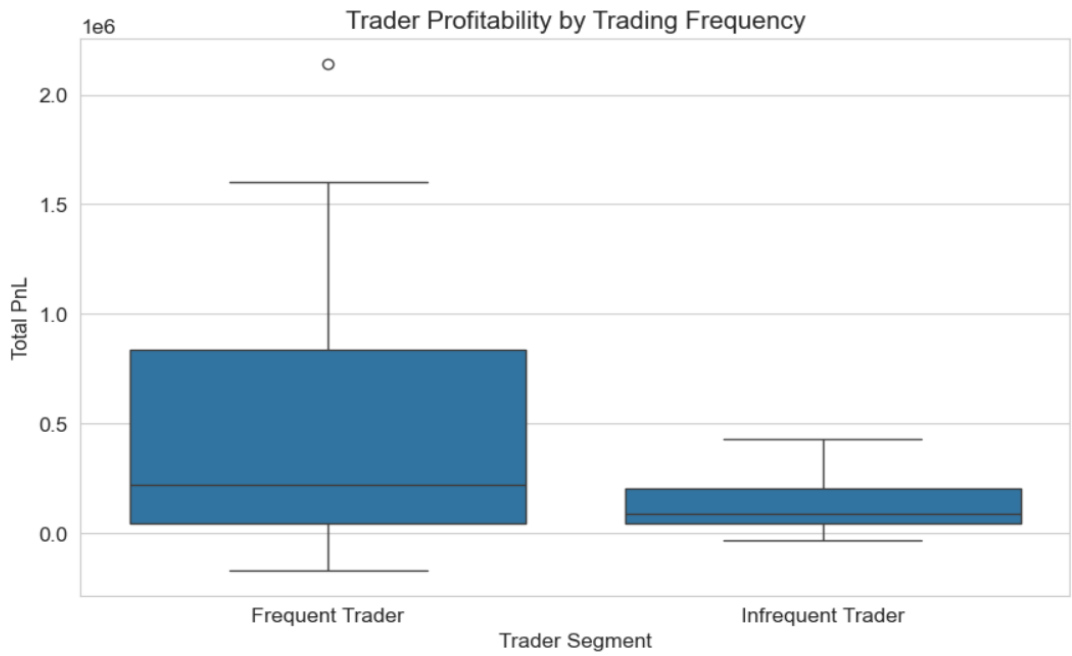
Trader Profitability by Position Size

Indicates that **traders using larger position sizes tend to achieve higher potential profits**, but also experience greater variability in outcomes.



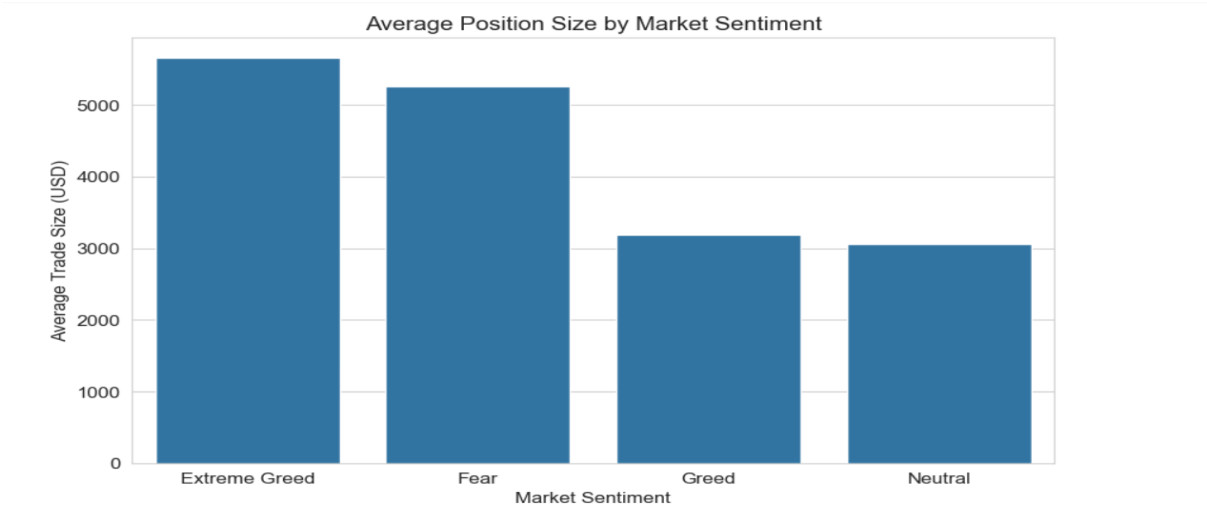
Profitability vs Trader Consistency

Shows that **inconsistent traders display much wider profit variability**, while consistent traders generate more stable but generally smaller returns.



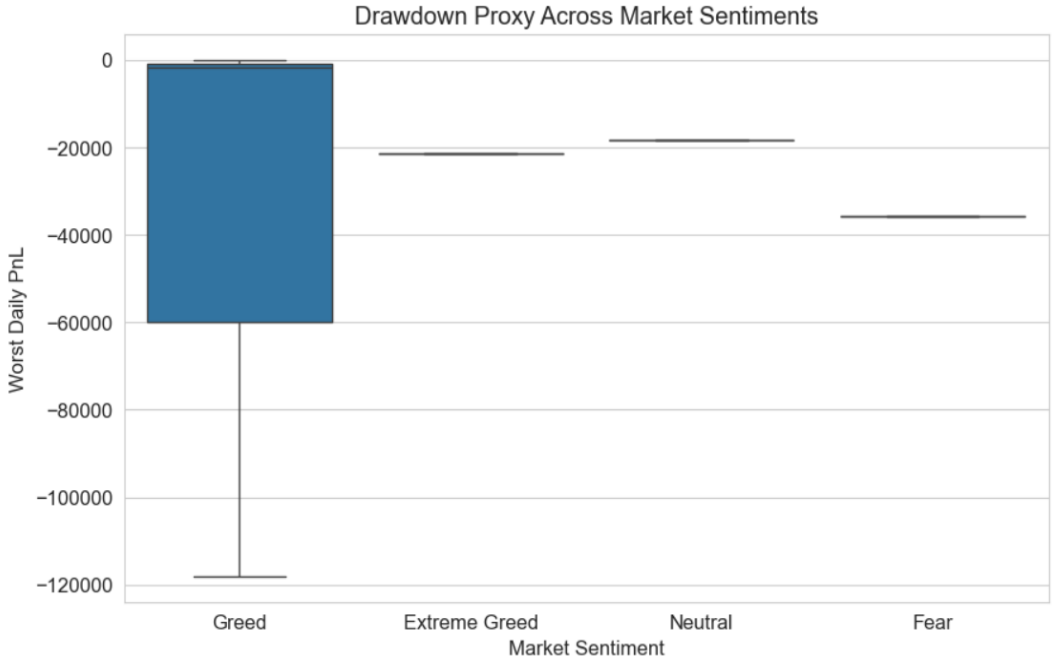
Trader Profitability by Trading Frequency

Highlights that **frequent traders tend to achieve higher overall profitability**, although their returns also exhibit greater dispersion.



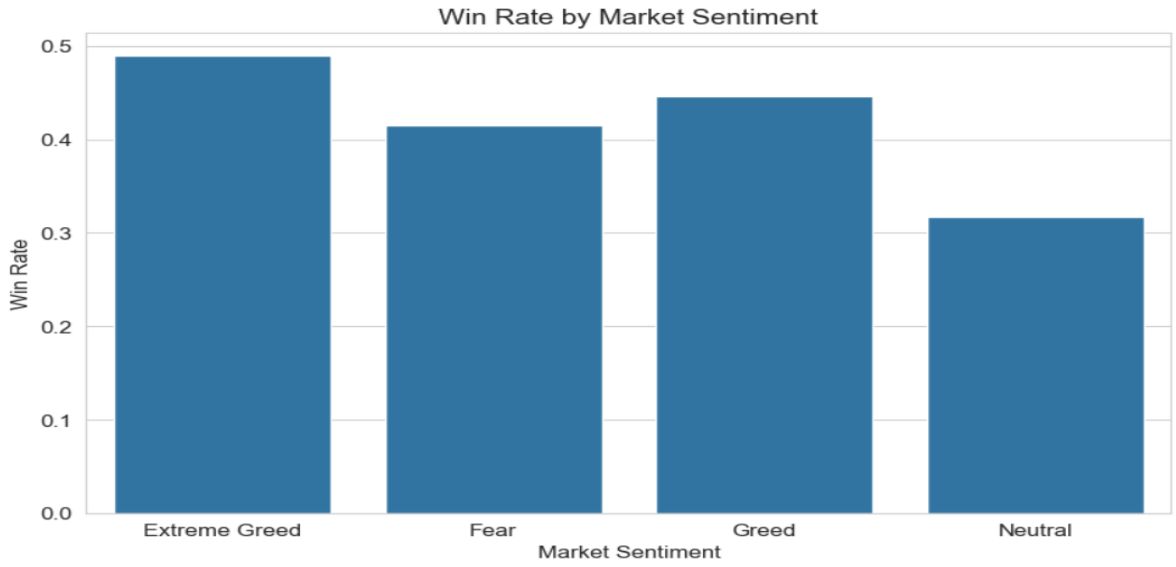
Average Position Size by Market Sentiment ***(second version of the metric visualization)***

Reinforces that **market sentiment significantly influences trade sizing behavior**, with larger trades occurring in Extreme Greed and Fear periods.



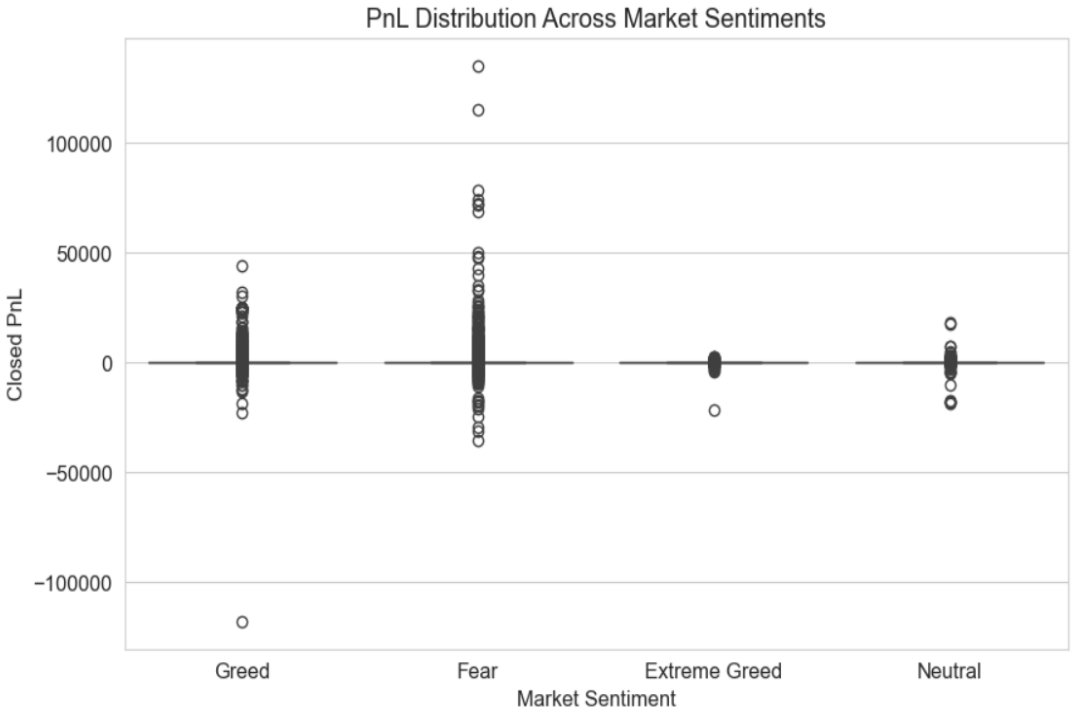
Drawdown Proxy Across Market Sentiments

Shows that **Greed markets experience deeper worst-case daily losses**, suggesting higher downside risk during optimistic market phases.



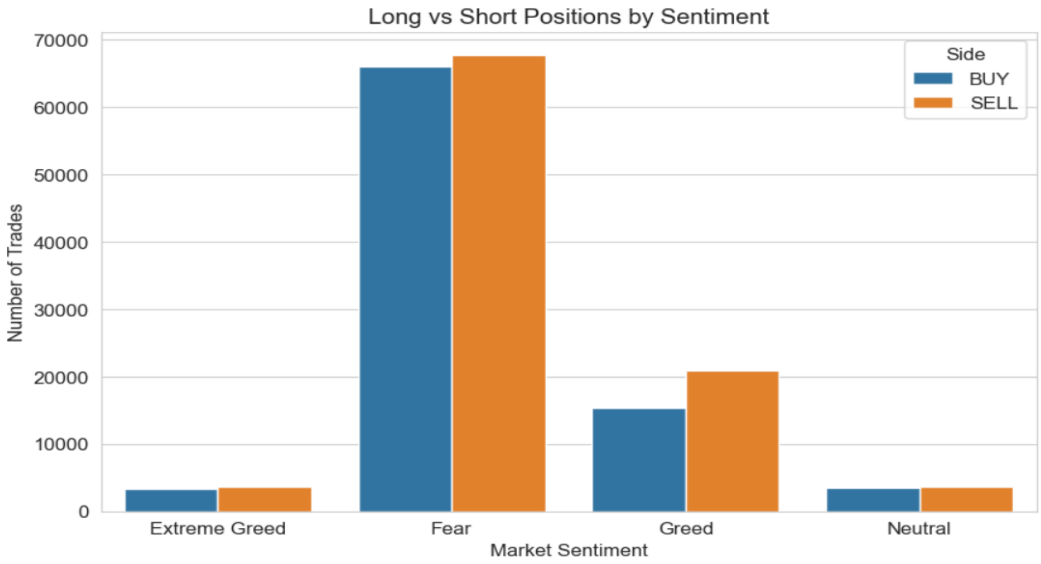
Win Rate by Market Sentiment

Indicates that **win rates vary by sentiment**, with Extreme Greed showing the highest success rate and Neutral markets the lowest.



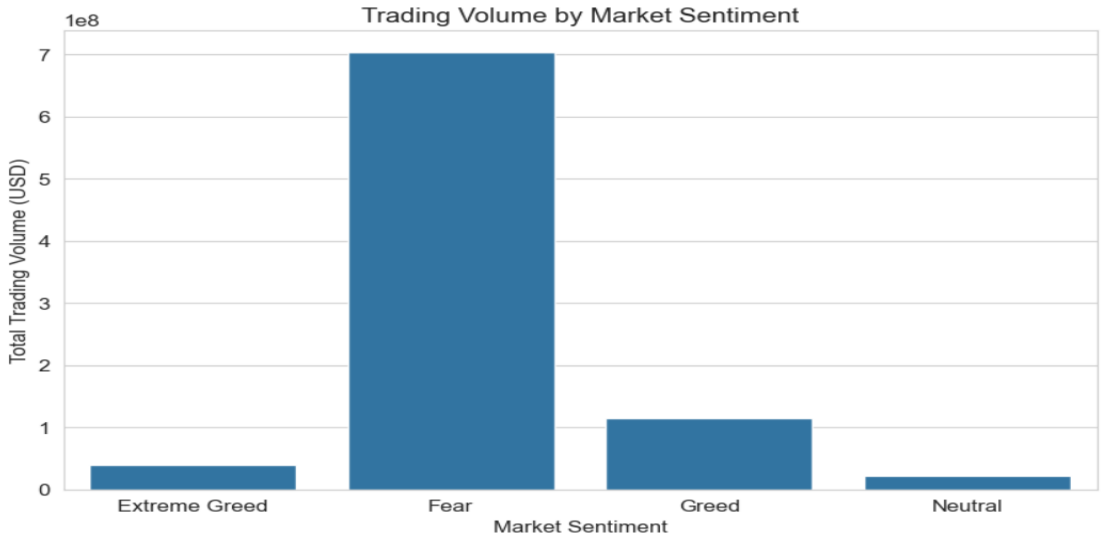
PnL Distribution Across Market Sentiments

Displays the **spread and variability of trader profits**, highlighting that Fear markets exhibit the largest dispersion of gains and losses.



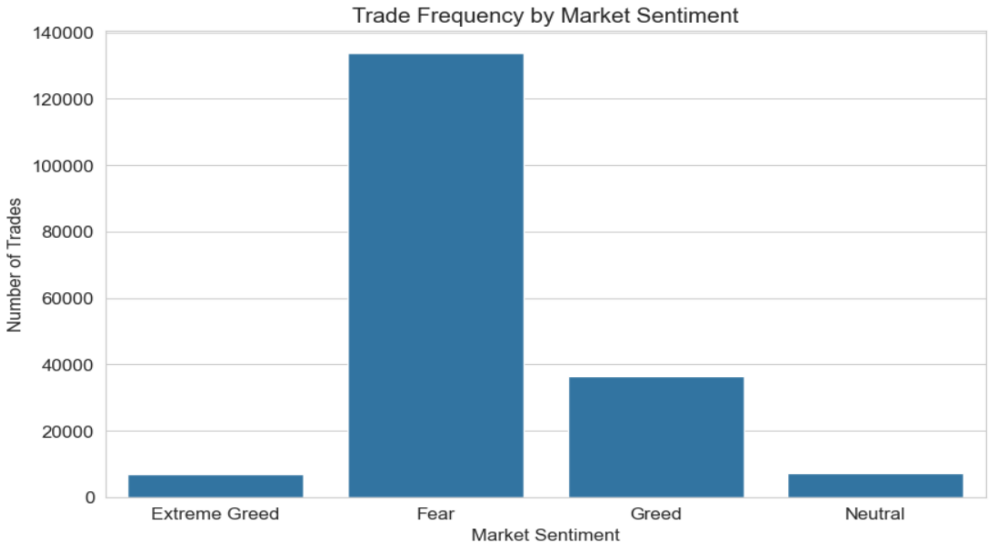
Long vs Short Positions by Sentiment

Illustrates that **both long and short positions increase significantly during Fear markets**, reflecting heightened trading activity.



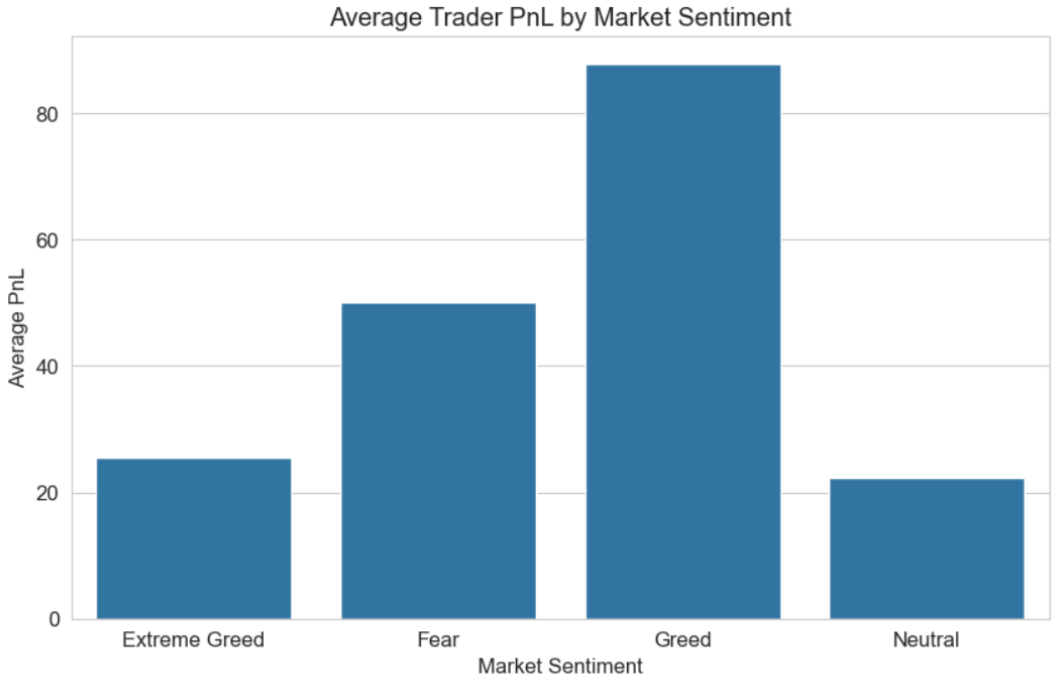
Trading Volume by Market Sentiment

Demonstrates that **total trading volume peaks during Fear periods**, indicating increased capital deployment when markets are volatile.



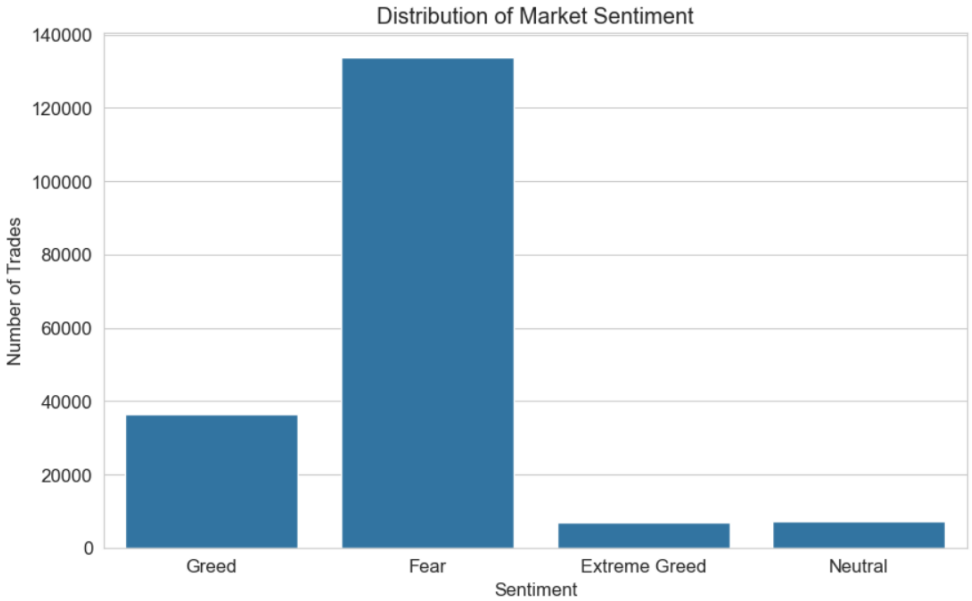
Trade Frequency by Market Sentiment

Shows that **Fear markets have the highest number of trades**, reinforcing the relationship between market uncertainty and trading activity.



Average Trader PnL by Market Sentiment

Shows that **Greed markets generate the highest average trader profits**, while Neutral and Extreme Greed periods produce lower returns.



Distribution of Market Sentiment

Reveals that **Fear dominates the dataset**, accounting for the majority of trades compared to other sentiment categories.
